Module Objectives

Build an Angular Service for Business Logic

Use that Service

Reuse that Service

Angular Line of Business Applications

Business Requirements

- Application Features
- Design Considerations
- Architecture

Layout and Navigation

- Page Layout (View)
- Style (Bootstrap)
- Navigation (Routing)

Data Access

- Retrieving data
- Saving data

Data Entry Forms

- Form layout
- Validation
- Submittal

Business Logic

- Services

Data Visualization

- Charts

Angular Services

Angular code that can be used to

- Organize application logic
- Encapsulate logic not directly related to a view or model
- Share logic (or data) across the application

Services can be

- Injected into any controller or other service
- Making it easily to use

Services are

- Lazily instantiated
- Singletons

Built-In vs Custom Services

Built-in services

- Prefixed with a "\$"
- Examples: \$http, \$resource, \$httpBackend

Custom services

- service method
- factory method

Factory Method

Register the service

- Name
- Factory function

```
angular  
  .module("common. services")  
  .factory("productService",  
          productService)
```

```
function productService() {  
}
```

Steps for Creating a Custom Service

Create a new JavaScript file

Insert a script tag into index.html

Register the Service with a Module

Write the Service Factory Function

Using a Custom Angular Service

Inject the service

Call the service

```
function ProductDetailCtrl (product, productService)
{
    productService.calculateMarginPercent (price, cost);
}
```

Product Detail View

Acme Product Management
